# DBMR Hot Lab Safety

## Course program

1. Introduction
2. Physics
3. Radiation safety
4. Legislation
5. Dosimetry
6. NuclidCalc App
7. Security of high radioactive sources
8. Questions

# Introduction

## What IS «radiation»?

### Electromagnetic waves

- AM radio, FM radio, shortwave radio, TV, cell phones, WiFi, microwave, visible light

*all harmless at low intensity*

- Near ultraviolet (UV)

*beneficial at low doses, Vitamin D*

- Far UV, X rays,  $\gamma$  rays

*damaging at all levels)*

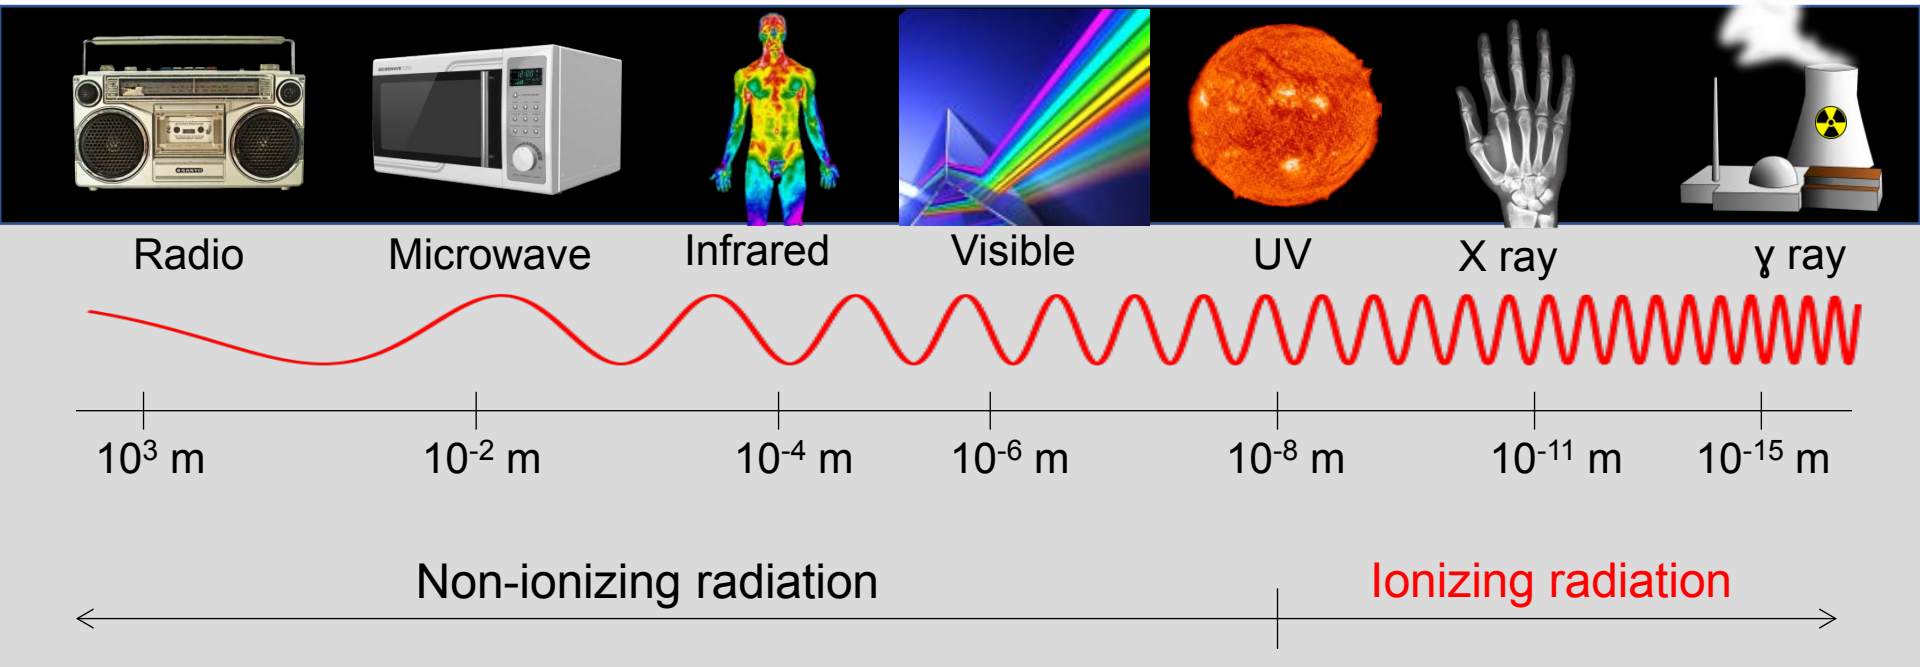

### Fast massive particles

- Electrons ( $\beta$  rays), protons, neutrons,  $\alpha$  rays ( $^4\text{He}$  nuclei), heavy ion beams

*damaging at all levels*

# Radiation

## Spectrum of electromagnetic waves

# Ionizing radiation

## What does the damage?

**Ionizing** radiation produces highly reactive *free radicals*

→ *pathological DNA **double** strand breaks, that are usually permanent, causing:*

Human lymphocyte chromosomes (Multi-Color FISH)

Non-irradiated

Irradiated

- **Cell Reproductive Death** (most common)
- **Genetic Mutation** (most subtle)
- **Cancer** (most unpleasant)

**Single** *strand breaks* usually heal in a few hours.

# Radioactivity

## What IS radioactivity?

### Radioactivity

is the property of unstable atoms (=radionuclides) to spontaneously transform into other atomic nuclei and thereby emit **ionizing radiation**.

This transformation is called **radioactive decay**.

There are >3000 known nuclides, of which about 250 are stable.

# Radionuclides

## What is the origin of radionuclides?

### Naturally occurring radionuclides:

- *Primordial nuclides* are remnants of nucleosynthesis in stars before the formation of the solar system. Half-life at least 2% of the age of the earth ( $4.6E+09$  a).
- *Radiogenic nuclides* are formed by radioactive decay.
- *Nucleogenic nuclides* occur, when atoms react with natural neutrons from cosmic rays, nuclear fission or other sources.

### Artificial radionuclides

- *Anthropogenic radionuclides*

# Physics

## Radioactive decay

### Half lifes of nuclides

### The decay law

Activity  $A$  = disintegration rate.  $N$  = number of unstable nuclei. The *decay coefficient*  $\lambda$  resp. the *half-life*  $T$  is constant and characteristic of each radionuclide.  $e$  = Euler number.  $t$  = elapsed time.

$$N_0 \text{ resp. } A_0$$

$$N_t = N_0 \times e^{-\lambda t}$$

$$N_t \text{ resp. } A_t$$

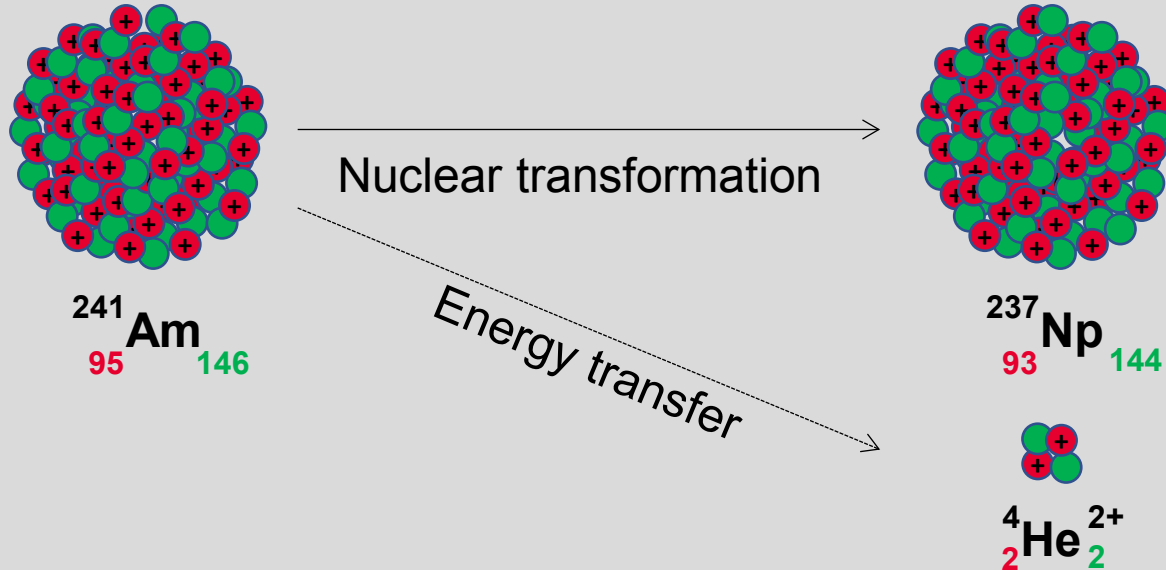

$$A_t = A_0 \times e^{-\lambda t} = \frac{A_0}{2^{\frac{t}{T}}}$$

# Radioactive decay

## Decay modes: $\alpha$ decay

Mass number  $A$

$Z$   $X$   $N$  Neutron number  $N$   
Proton number  $Z$

**$\alpha$  radiation**

consists of alpha particles that are made up of two protons and two neutrons each and that carry a double positive charge

# Radioactive decay

## Decay modes: $\beta^-$ decay

**n** = Neutron  
**p** = Proton  
**e<sup>-</sup>** = Electron  
 **$\bar{\nu}_e$**  = Antineutrino

### $\beta^-$ radiation

consists of negatively charged particles that are ejected from an atom's nucleus and that are physically identical to electrons.

# Radioactive decay

## Decay modes: $\beta^+$ decay

**p** = Proton (+)

**n** = Neutron

**e<sup>+</sup>** = Positron (+)

**$\nu_e$**  = Neutrino

### $\beta^+$ radiation

consists of positively charged particles that are ejected from an atom's nucleus and that are physically identical to positrons.

# Radioactive decay

## Decay modes: $\gamma$ decay

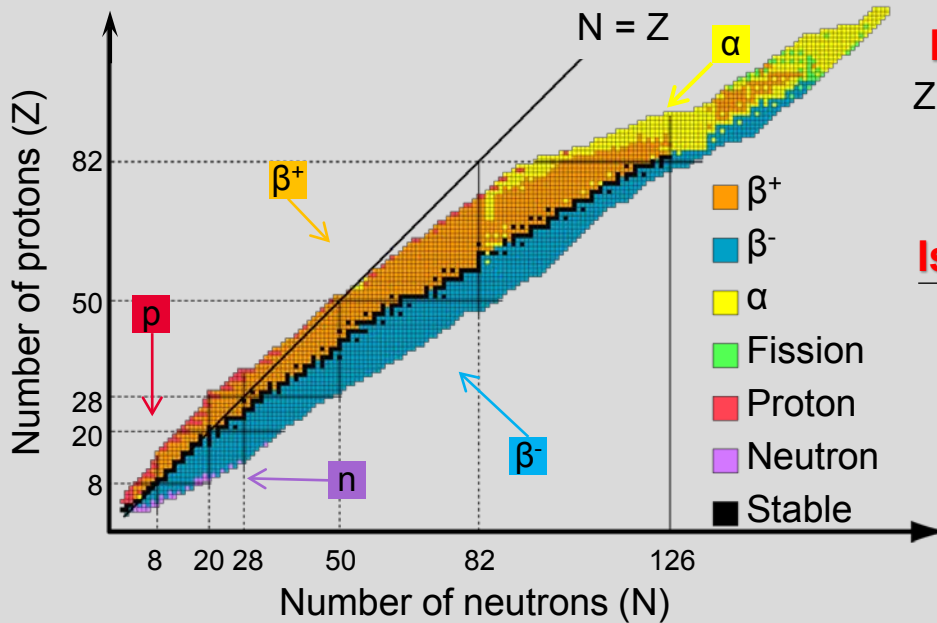

Ba-137 and Ba-137m (metastable) are *nuclear isomers*. They have the same number of protons and neutrons.

**$\gamma$  radiation** consists of photons that originate from *within* the nucleus, whereas **X-ray radiation** consists of photons that originate from *outside* the nucleus.

# Radioactive decay

## Karlsruhe nuclide chart

### Isobares

$$Z_1 + N_1 = Z_2 + N_2$$

### Isotopes

$$Z_1 = Z_2$$

$^{12}_7\text{N}_5$	$^{13}_7\text{N}_6$	$^{14}_7\text{N}_7$	$^{15}_7\text{N}_8$
$^{11}_6\text{C}_5$	$^{12}_6\text{C}_6$	$^{13}_6\text{C}_7$	$^{14}_6\text{C}_8$
$^{10}_5\text{B}_5$	$^{11}_5\text{B}_6$	$^{12}_5\text{B}_7$	
$^9_4\text{Li}_5$	$^{10}_4\text{Li}_6$		

### Isotones

$$N_1 = N_2$$

### Isodiaphers

$$N_1 - Z_1 = N_2 - Z_2$$

I-125	60.14 d	$\epsilon$ , $\gamma$	$\gamma$ : 27	Lead (5 cm)	Te-125
I-131	8.04 d	$\beta^-$ , $\gamma$	$\beta^-$ : 192 $\gamma$ : 637	Lead (5cm)	Xe-131
Cs-137	30.08 a	$\beta^-$ , $\gamma$	$\beta^-$ : 195 $\gamma$ : 660	Lead (5 cm)	Ba-137

# Radiation safety

## Principles in radiation safety

### I. Justification

Principle of the necessity of a radiation application resp. justification of a an exposure to radiation (RPA art. 8).

A justification is required if the radiation dose is  $>0.01$  mSv/a for bystanders or  $>0.1$  mSv/a for occupationally exposed persons.

### II. Optimization (ALARA)

Optimization of radiation protection measures to keep radiation doses «**As Low As Reasonably Achievable - ALARA**» (RPA art. 9).

# Principles in radiation safety

## ALARA

### Distance

Doubling the distance quarters the dose rate.

$$\dot{D}_2 = \dot{D}_1 \times \left(\frac{r_1}{r_2}\right)^2$$

$\dot{D}$  = Dose rate [mSv/h]

$r$  = Distance to radiation source

*Not true if:*

- fast massive particles
- $r < 0.1$  m

<sup>1</sup> Rule of thumb –

Range depends on the energy of the radiation

<sup>2</sup> Tenth value layer (TVL)

Range	Air	Water
$\alpha$	cm	$\mu\text{m}$
$\beta$	m <sup>1</sup>	mm <sup>1</sup>
TVL <sup>2</sup>	Air	Water
$\gamma$	$\frac{1}{2}$ km <sup>1</sup>	$\frac{1}{2}$ m <sup>1</sup>
n	«wide» <sup>1</sup>	( $\frac{1}{4}$ m <sup>1</sup> )

# Principles in radiation safety

## ALARA

### Activity

The lower the activity, the lower the dose rate.

It is not reasonable to use higher activities just in order to speed up experiments.

Buy only as much as you need in the near future.

Regardless of natural isotopic decay, radiochemicals decay faster than their nonradioactive counterparts, due to

- direct interaction with radioactive emission ( $\alpha$ ,  $\beta$ ,  $\gamma$ ),
- interaction with excited species of the compound,
- thermodynamic instability and
- poor choice of storage conditions.

# Principles in radiation safety

## ALARA

### Shielding

Since *alpha particles* ionize very strongly, they can be completely shielded with a sheet of paper.

All *beta particles* can be shielded with 1 cm perspex/plexiglas.

*Gamma rays* can not be completely shielded, they can only be attenuated. The higher the Z number of the shielding material, the more it attenuates  $\gamma$  rays.

# Principles in radiation safety

## ALARA

### Tenth-value layer (TVL) for photons

$$H_p = \frac{A \times t \times h_{10} \times \left(\frac{1m}{r}\right)^2}{10^{\frac{d}{TVL}}}$$

$H_p$ : Equivalent dose in tissue at 10 mm depth

$A$ : Activity

$t$ : Time

$h_{10}$ : Nuclide specific dose estimation factor

$r$ : Distance from the source

$d$ : Thickness of the shielding material

Energy of photons in keV	TVL in mm Pb
100	3 mm
500	16 mm
1000	38 mm
1500	51 mm
2000	59 mm
3000	65 mm

# Principles in radiation safety

## ALARA

### Prevent spreading of radioactive materials

- Keep active and inactive work separated
- Always work over a spill tray within a ventilated enclosure
- Monitor the work area frequently for contamination
- Follow the rules

# Principles in radiation safety

## ALARA

**Wear appropriate protective clothing and dosimeters**

Wear the dosimeter, laboratory coat, safety glasses, gloves, long trousers and closed shoes when you are working with radiochemicals

# Principles in radiation safety

## ALARA

### Minimize time spent in handling radioactivity

Plan ahead. Perform cold runs to practice and to check procedures.

### Never forget to do this

After completion of work, monitor yourself, wash and monitor again.

Contamination monitor

# Principles in radiation safety

## ALARA

### Minimize accumulation of waste

Disposal of waste is subject to statutory control. Separate radioactive waste by nuclide, state of aggregate (solid/liquid) and combustibility.

Nuclides with a half life  $< 100$  days are stored until they decayed below  $10 \text{ kg} \cdot \text{LL}$  and then disposed of as non-radioactive waste. Tritium and carbon-14 are released to the environment in a controlled manner as well ( $<10 \text{ kg} \cdot \text{LL}$  per week).

# Principles in radiation safety

## Dose limits

### Dose limits for occupational exposed persons

The system of dose limits for the protection of individuals is in accordance with the recommendations of the International Commission on Radiological Protection ICRP (RPA art. 10).

### Dose limit values for occupational exposed healthy adults

The *effective dose*  $E$  must not exceed the limit of 20 mSv/a for adult individuals of category B resp. 5 mSv/a for individuals of cat. A. Pregnant women:  $\leq 1$  mSv to the unborn child.

The *equivalent dose*  $H$  must not exceed the following limits:

- For the lens of the eye: 20 mSv/a
- For the skin, hands and feet: 500 mSv/a

# Operational radiation safety

## Working zones

Depending on the *degree of contamination* which is present or expected, zones are classified into the following types:

Zone	Surface contamination $C_S$	Airborne contamination $C_A$
0	$C_S < 1 \text{ CS}^1$	$C_A < 0.05 \text{ CA}^2$
I	$C_S < 1 \text{ CS}$	$0.05 \text{ CA} \leq C_A < 0.1 \text{ CA}$
II	$1 \text{ CS} \leq C_S < 10 \text{ CS}$	$0.05 \text{ CA} \leq C_A < 0.1 \text{ CA}$
III	$10 \text{ CS} \leq C_S < 100 \text{ CS}$	$0.1 \text{ CA} \leq C_A < 10 \text{ CA}$
IV	$C_S \geq 100 \text{ CS}$	$C_A \geq 10 \text{ CA}$

← D-Laboratory

← C-Laboratory

<sup>1</sup> Guidance value (Bq/cm<sup>2</sup>) for surface contamination as specified in RPO, Annex 3 Column 12; averaged over 100 cm<sup>2</sup>.

<sup>2</sup> Guidance value (Bq/m<sup>3</sup>) for chronic airborne activity as specified in RPO, Annex 3 Column 11.

# Operational radiation safety

## Working areas

Within working zones, where ambient dose rates  $\dot{D}$  are elevated, the following areas are designated with maximum permissible ambient dose rates:

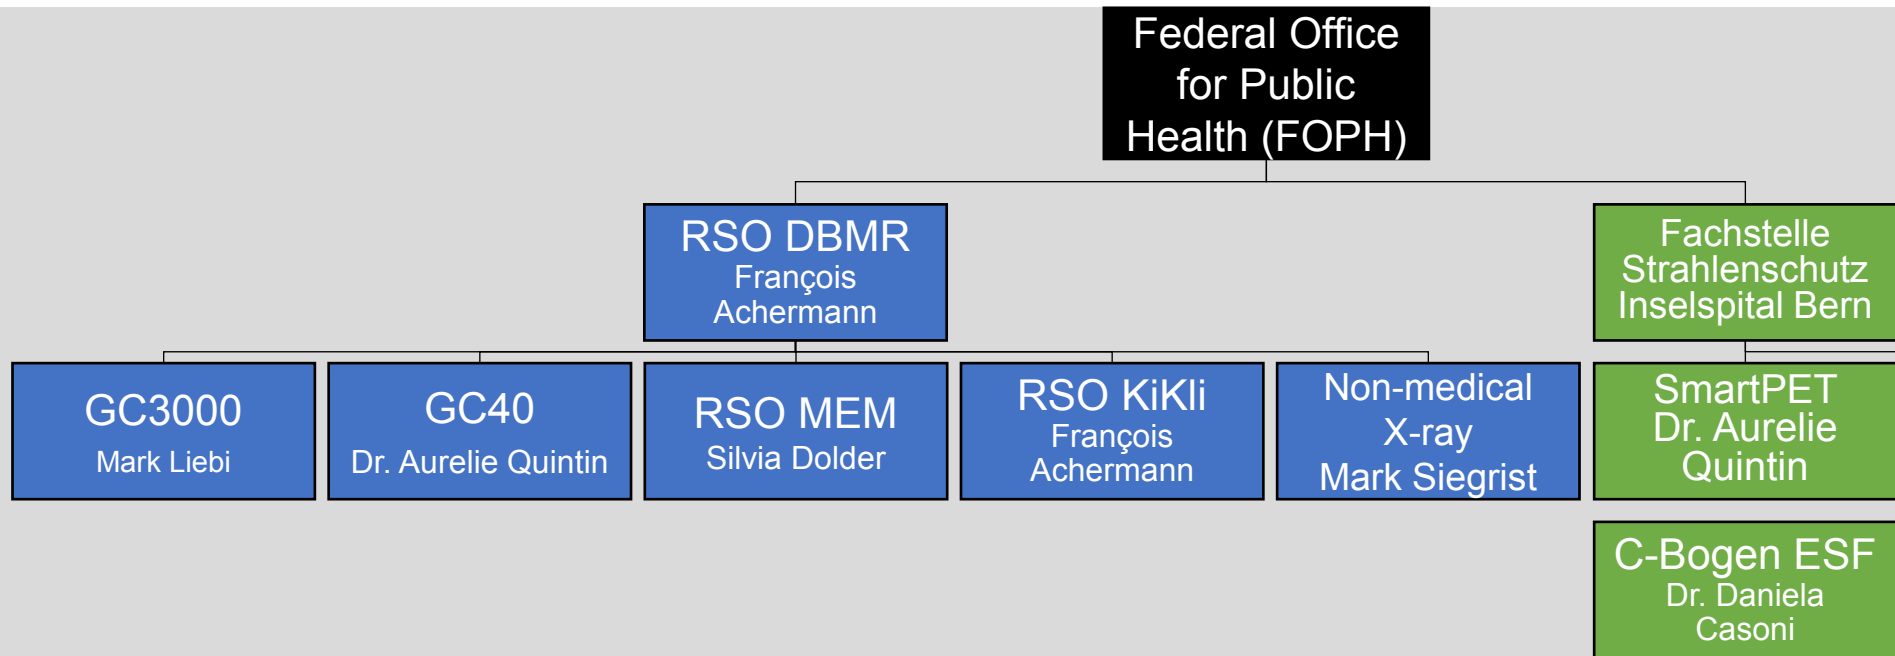

Area	Ambient dose rate $\dot{D}$ at accessible locations
V	$\dot{D} < 10 \mu\text{Sv/h}$
W	$10 \mu\text{Sv/h} < \dot{D} < 100 \mu\text{Sv/h}$
X	$100 \mu\text{Sv/h} < \dot{D} < 1 \text{mSv/h}$
Y	$1 \text{mSv/h} < \dot{D} < 10 \text{mSv/h}$
Z	$\dot{D} > 10 \text{mSv/h}$

← e.g. near X-ray systems without full protection.

# Radiation safety in the DBMR

## Organization

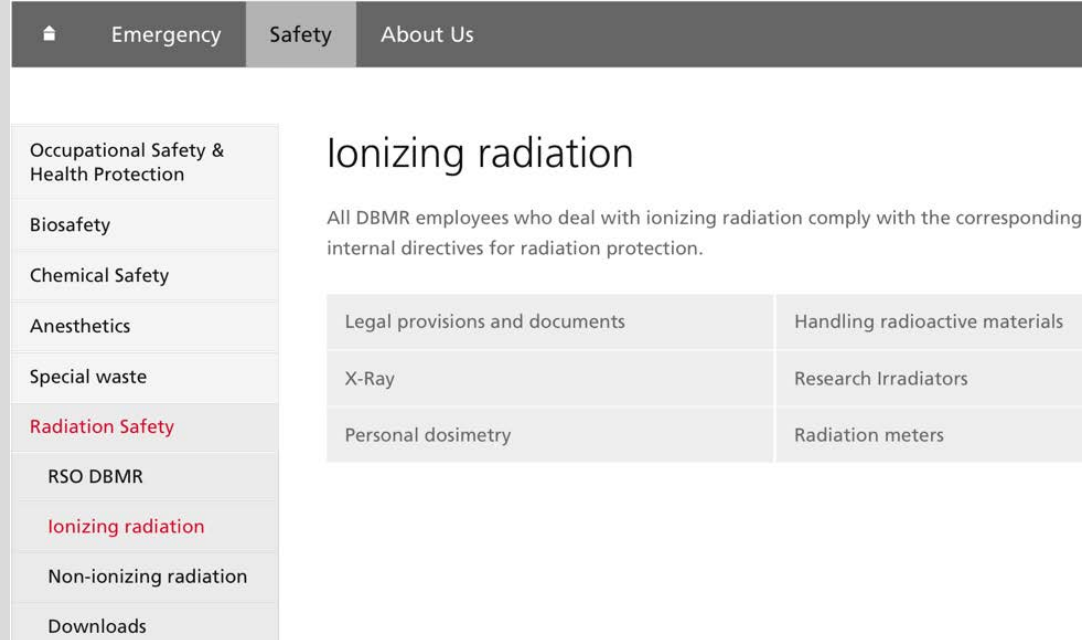

# Informations on the DBMR safety microsite

[www.safety.dbmr.unibe.ch](http://www.safety.dbmr.unibe.ch)

## Internal directives for radiation safety

- Handling radioactive materials
- Thyroid triage for I-125
- Wipe-testing for H-3 and C-14
- Gammacell 40 research irradiator
- Gammacell 3000 research irradiator
- XCT 969
- Disposal H-3 and C-14 (UniBE)
- Radiation safety handbook (Insel)

The screenshot shows a navigation menu with three items: 'Emergency', 'Safety', and 'About Us'. Below the menu is a list of categories: 'Occupational Safety & Health Protection', 'Biosafety', 'Chemical Safety', 'Anesthetics', 'Special waste', 'Radiation Safety' (highlighted in red), 'RSO DBMR', 'Ionizing radiation' (highlighted in red), 'Non-ionizing radiation', and 'Downloads'. To the right of the menu, the main content area displays the title 'Ionizing radiation' and a paragraph: 'All DBMR employees who deal with ionizing radiation comply with the corresponding internal directives for radiation protection.' Below this text is a grid of links: 'Legal provisions and documents', 'X-Ray', 'Personal dosimetry', 'Handling radioactive materials', 'Research Irradiators', and 'Radiation meters'.

# Radiation Safety Officers (RSO)

## Duties and responsibilities of the RSO

- Coordination of the licensing processes
- Control of the planning and execution of architectural radiation protection measures
- Designation of working areas and access authorization to controlled zones
- Designation of exposed persons and organization of the dosimetry
- Risk assessment for all activities with sources of ionizing radiation
- Quality assurance of the radiation meters
- Contamination monitoring
- Inventory of all radioactive materials
- Controlled release of radioactive waste to the environment
- Annual statement on the turnover of radioactive materials and on the release of radioactive waste to the environment
- Training and instruction of exposed persons
- Monitoring compliance with radiation safety regulations

# Operational radiation safety

## Procurement and storage of radioactive materials

- The local RSO must be informed about the ordering of radioactive materials
- Upon delivery of radioactive material the local RSO must receive a copy of the delivery note and must be informed about the storage site
- Keep records of your inventory of radioactive materials at all time
- Clearly label containers (nuclide, total activity, date, owner, radiation propeller)
- Per fire compartment, a total activity <1 licensing limit (LA) can be stored/handled per day in a demarked area within a normal lab (→ D-Lab)
- Radioactive materials are stored exclusively in the approved and marked storage locations

# Swiss legislation in radiation protection

## Overview

<sup>1</sup> Federal Department of Home Affairs

<sup>2</sup> Federal Office of Public Health

# Revised legislation in radiation protection

## What are the main changes since 2018?

- Authorization and supervision are based on risk-graded system
- Radiological security is strengthened
- Internationally harmonized exemption limits (LL)
- Lower limit of radiation dose for the eye lens
- Regular training is required in radiation protection
- Better protection of patients, staff and the environment through clinical audits
- Exposure to natural radiation at work is considered as occupational exposure
- When building, the radon load must be paid more attention.

# Dosimetry

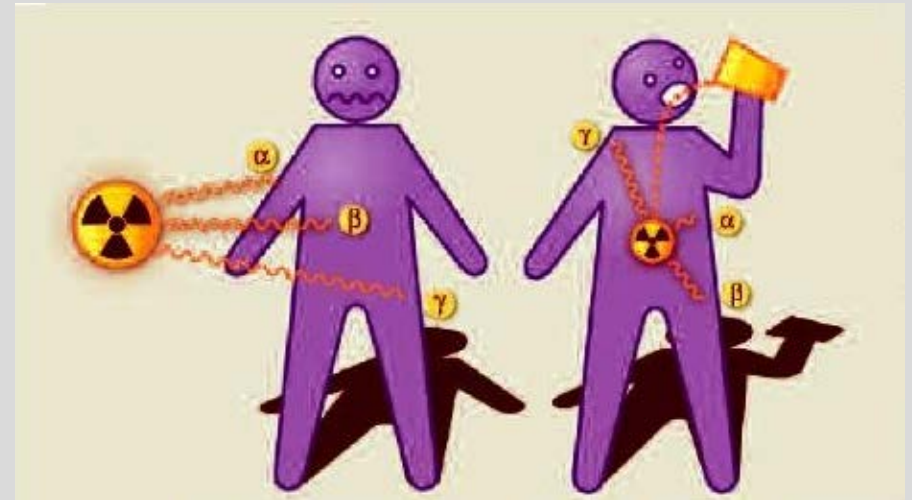

## Exposure to ionizing radiation

### Three types of exposure

1. External irradiation
2. Skin contamination with radionuclides
3. Incorporation of radionuclides by inhalation, ingestion or diffusion through skin

Doses depends:

- Nuclide species
- Activity / dose rate
- Type of exposure
- Exposure time

# Dosimetry

## External irradiation

### Personal dosimeter

External irradiation is individually determined monthly by means of TLD-dosimeter. The dosimeter must be worn on the torso. Pregnant women wear the dosimeter at abdominal level.

### Who must wear a dosimeter?

Persons working in controlled zone are occupationally exposed to radiation and must undergo dosimetry.

The local RSO designates the occupationally exposed persons.

# Dose quantities

## Absorbed dose $D$

The fundamental dose quantity given by:

$$D = \frac{d\bar{\epsilon}}{dm}$$

where  $d\bar{\epsilon}$  is the mean energy imparted to matter of mass  $dm$  by ionizing radiation.

The SI unit for absorbed dose is joule per kilogram ( $J/kg$ ), and its special name is gray ( $Gy$ ).

# Dose quantities

## Equivalent dose $H$

The *equivalent dose*  $H$  in a tissue or organ  $T$  is given by:

$$H_T = \sum_R W_R \times D_{T,R}$$

where  $D_{T,R}$  is the mean *absorbed dose*  $D$  from radiation  $R$  in a tissue or organ  $T$ , and  $W_R$  is the radiation weighting factor. Since  $W_R$  is dimensionless, the unit for the equivalent dose is the same as for absorbed dose,  $J/kg$ . Its name is Sievert ( $Sv$ ).

### Radiation weighting factors $W_R$

Radiation type	$W_R$
X	1
$\gamma$	1
$\beta$	1
$\alpha$	20
n	5-20*
p	2

\* Depending on the kinetic energy of the absorbed neutrons

# Dose quantities

## Personal dose equivalents $H_p(d)$

The *personal dose equivalent*  $H_p(d)$  is the *absorbed dose*  $D$  in soft tissue at an appropriate depth  $d$  [mm], below a specified point on the human body.

The *personal dose equivalent*  $H_p(10)$  is used as an estimate of the *effective dose*  $E$ .

The *personal dose equivalent*  $H_p(0.07)$ , also called  $H_S$ , is used as an estimate of the dose to the skin and to the lens of the eye.

The unit of personal dose equivalent is *sievert* (Sv).

$$\gamma, X, \text{ if } r > 0.1 \text{ m:}$$

$$H_p(10) = A \times t \times h_{10} \times \left(\frac{1 \text{ m}}{r}\right)^2$$

$\beta, \gamma, X$ , if  $r < 0.1$  m:

$$H_p(0.07) = H_S = A \times t \times h_{0.07}$$

If skin contamination:

$$H_S = \frac{A}{\text{surface}} \times t \times h_{c0.07}$$

$h_{10}$ ,  $h_{0.07}$  and  $h_{c0.07}$  values published in RPO, annex 3

# Dose quantities

Equivalent dose values  $h_{10}$ ,  $h_{0.07}$  and  $h_{c0.07}$

Nuclide	$h_{10}$ (mSv/h) / GBq in 1m distance	$h_{0.07}$ (mSv/h) / GBq in 10 cm distance	$h_{c0.07}$ (mSv/h) / (kBq/cm <sup>2</sup> )
H-3	<0.001	<1	<0.1

I-131	0.062	1000	1.4
Cs-137	0.092	2000	1.5

# Dose quantities

## Equivalent dose $H_p(10)$

### Example:

A person stays 42 hours at a distance of 0.4 meters from an unshielded 50 MBq Fe-59 source. What is the equivalent dose  $H_p(10)$ ?

Nuclide: Fe-59

A: 50MBq = 0.05 GBq

T: 42 h

r: 0.4 m

$h_{10}$ :  $0.175 \frac{mSv}{h \times GBq}$  @ 1m

$H_p(10) = ?$

$$H_p(10) = \text{Activity } A [GBq] \times \text{time } [h] \times h_{10} \left[ \frac{mSv/h}{GBq} \right] \times \left( \frac{1 \text{ m}}{r} \right)^2$$

$$H_p(10) = 0.05 \text{ GBq} \times 42\text{h} \times 0.175 \frac{mSv}{h \times GBq} \times \left( \frac{1 \text{ m}}{0.4 \text{ m}} \right)^2 = \mathbf{2.3 \text{ mSv}}$$

# Dose quantities

## Skin dose $H_S$

### Example:

A person holds her hand for 2 hours at a distance of 10 cm to a 50 MBq Ca-45 source. What is the skin dose  $H_S$  of the hand?

$$H_S = \text{Activity [GBq]} \times t [h] \times h_{0.07} \left[ \frac{\text{mSv/h}}{\text{GBq @ a distance of 10 cm}} \right]$$

$$H_S = 0.05 \text{ GBq} \times 2 \text{ h} \times \frac{700 \text{ mSv/h}}{\text{GBq at a distance of 10 cm}} = \mathbf{70 \text{ mSv}}$$

Nuclide: Ca-45

A: 50MBq = 0.05 GBq

t: 2 h

r: 10 cm

$h_{0.07}$ :  $700 \frac{\text{mSv}}{\text{h} \times \text{GBq}} @ 10 \text{ cm}$

$H_S$  resp.  $H_p(0.07) = ?$

# Dose quantities

## Skin dose $H_S$ due to contamination

### Example:

A person contaminates a skin area of 50 cm<sup>2</sup> with 100 MBq of P-32. 5 minutes pass until decontamination. What is the skin dose  $H_S$ ?

$$H_S = \frac{\text{Activity [kBq]}}{\text{Area [cm}^2\text{]}} \times t [\text{h}] \times h_{c0.07} \left[ \frac{\text{mSv/h}}{\text{kBq/cm}^2} \right]$$

$$H_S = \frac{100'000 \text{ kBq}}{50 \text{ cm}^2} \times 0.083 \text{ h} \times \frac{1.6 \text{ mSv/h}}{\text{kBq/cm}^2} = \mathbf{266 \text{ mSv}}$$

Nuclide: P-32

A: 100MBq = 10<sup>5</sup> kBq

t: 5 min = 0.083 h

Area: 50 cm<sup>2</sup>

$h_{c0.07}$ : 1.6  $\frac{\text{mSv/h}}{\text{kBq/cm}^2}$

$H_S = ?$

# Dose quantities

## Effective dose $E$

The *effective dose*  $E$  is the tissue-weighted sum of the *equivalent doses*  $H_T$  in all specified tissues and organs is given by the expression

$$E = \sum_T W_T \times H_T$$

The unit of the effective dose is  $J/kg$ , and it's name is *Sievert* ( $Sv$ ).

### Tissue weighting factors $W_T$

Tissue or organ	$W_T$
Brain, skin, bone surface, salivary glands	0.01
Bladder, liver, oesophagus, thyroid	0.04
Gonads	0.08
Bone-marrow, colon, lung, breast, stomach, remainder tissues	0.12

# Dose quantities

## How bad is how much?

	nSv/a	
	μSv/a	Return flight Zürich-Los Angeles = 60 μSv
	1 mSv/a	Annual limit value for the population
	3 mSv/a	Approx. natural annual dose
	20 mSv/a	Limit for occupationally exposed persons
	200 mSv	1% additional risk of cancer
	1 Sv	Deterministic health damage
	7 Sv	Instant death

## Internal irradiation

# Intake of radioactive material into the body

### Committed equivalent dose $H_T(\tau)$

The time integral of the equivalent dose rate in a particular tissue or organ that will be received following the intake of radionuclides into the body, where  $\tau$  is the integration time in years.

### Committed effective dose $E_{50}$

The committed effective dose  $E_{50}$  is the sum of the products of the committed equivalent doses  $H_T(\tau)$  and the appropriate tissue weighting factors  $W_T$ . The commitment period following the intake is taken to be 50 years for adults.

Inhalation:

$$E_{50} = A_{inh} \times e_{inh}$$

Ingestion:

$$E_{50} = A_{ing} \times e_{ing}$$

$$[Sv] = [Bq] \times [Sv/Bq]$$

# Internal irradiation

## Effective dose values $e_{inh}$ and $e_{ing}$

Nuclide	$e_{inh}$ (Sv/Bq)	$e_{ing}$ (Sv/Bq)
H-3	4.1E-11	4.2E-11
C-14	5.8E-10	5.8E-10
P-32	2.9E-09	2.4E-09
S-35	1.2E-10	7.7E-10
Ca-45	2.3E-09	7.6E-10
Cr-51	3.6E-11	3.8E-11
Fe-55	9.2E-10	3.3E-10
Co-57	6.0E-10	2.1E-10

Nuclide	$e_{inh}$ (Sv/Bq)	$e_{ing}$ (Sv/Bq)
Fe-59	3.2E-09	1.8E-09
Ga-68	8.1E-11	1.0E-10
In-111	3.1E-10	2.9E-10
I-123	1.1E-10	2.1E-10
I-124	6.3E-09	1.3E-08
I-125	7.3E-09	1.5E-08
I-131	1.1E-08	2.2E-08
Cs-137	6.7E-09	1.3E-08

The nuclide specific values  $e_{inh}$  and  $e_{ing}$  are listed in RPO, annex 3, columns 4 and 5

# Internal irradiation

## Committed effective dose $E_{50}$

### Example

A person inhales 70 MBq of I-125. What is the committed effective dose  $E_{50}$ ?

$$E_{50} = \text{Activity [Bq]} \times e_{inh}[\text{Sv/Bq}]$$

$$E_{50} = 7 \cdot 10^7 \text{ Bq} \times 7.3 \cdot 10^{-9} \text{ Sv/Bq} = \mathbf{511 \text{ mSv}}$$

Nuclide: I-125

$$A: 70 \text{ MBq} = 7 \times 10^7 \text{ Bq}$$

$$e_{inh}: 7.3 \times 10^{-9} \text{ Sv/Bq}$$

$$E_{50} = ?$$

# Internal irradiation

## Committed effective dose $E_{50}$

### Example

A person ingests 1 mCi of H-3. What is the committed effective dose  $E_{50}$ ?

$$E_{50} = \text{Activity [Bq]} \times e_{ing} [\text{Sv/Bq}]$$

$$E_{50} = 3.7 \times 10^7 \text{ Bq} \times 4.2 \cdot 10^{-11} \text{ Sv/Bq} = \mathbf{42 \text{ mSv}}$$

Nuclide: H-3

$$A: 1 \text{ mCi} = 3.7 \times 10^7 \text{ Bq}$$

$$e_{ing}: 4.2 \times 10^{-11} \text{ Sv/Bq}$$

$$E_{50} = ?$$

# Internal irradiation

## Who must monitor internal irradiation?

Nuclide	Annual turnover	If volatile
H-3	20 GBq	2 GBq
C-14	1.8 GBq	180 MBq
P-32	400 MBq	40 MBq
S-35	8 GBq	800 MBq
Ca-45	400 MBq	40 MBq
Cr-51	20 GBq	2 GBq
Fe-55	10 GBq	1 GBq
Co-57	1.6 GBq	160 MBq

Nuclide	Annual turnover	If volatile
Fe-59	400 MBq	40 MBq
Ga-68	12 GBq	1.2 GBq
In-111	4 GBq	400 MBq
I-123	1 GBq	
I-124	16 MBq	
I-125	14 MBq	
I-131	10 MBq	
Lu-177	1 GBq	100 MBq

# Dosimetry

## Summary

Unit	Used for	Base units of measurement	Derivited units		Conversion
			old	new (SI)	
<b>Activity A</b>	Radioactive materials	Activity <b>A</b> Disintegrations per time «disintegration rate» $s^{-1}$	Curie <b>Ci</b>	Becquerel <b>Bq</b>	$1 Ci = 3.7 \times 10^{10} Bq$ (=activity of 1 gr. radium)
<b>Absorbed dose D</b>	Irradiation of material	Energy per mass $J \times kg^{-1}$	Rad <b>Rd</b>	Gray <b>Gy</b>	$1 Gy = 100 rd$ (radiation absorbed dose)
<b>Dose rate <math>\dot{D}</math></b> $\dot{D} = D/t$	Irradiation of material	Absorbed dose per mass and time $J \times kg^{-1} \times s^{-1}$	<b>Rd/h</b>	<b>Gy/h</b>	t: duration of exposure
<b>Ion dose I</b>	Radiation meters	Charge per mass $As \times kg^{-1}$	Roentgen <b>R</b>		$1 \frac{As}{kg} = 3.876 \times 10^3 R$

# Dosimetry

## Summary

Unit	Used for	Base units of measurement	Derivited units		Conversion
			old	new (SI)	
<b>Dose equivalent H</b>	Irradiation of organs	A kind of damage unit, depending on the type of radiation $J \times kg^{-1}$	<b>rem</b>	Sievert <b>Sv</b>	$1 Sv = 100 rem$ (radiation equivalent man)
<b>Effective dose E</b>	Irradiation of people	Transforms organ irradiation into a whole-body dose of the same late-risk $J \times kg^{-1}$		Sievert <b>Sv</b>	
<b>Comitted effective dose E<sub>50</sub></b>	Irradiation of peope	Sum of the products of the committed equivalent doses $H_T(\tau)$ and the appropriate tissue weighting factors $W_T$ over 50 years. $J \times kg^{-1}$		Sievert <b>Sv</b>

# Security of high radioactive sealed sources

## Dangerous quantities of radioactive material

### Definition

High-activity sealed source means a sealed radioactive source whose activity is greater than the activity D-value specified in the radiation protection ordinance, Annex 9.

Protection class (CH)	Activity in D-values
A	$A \geq 1000 D$
B	$10 D \leq A < 1000 D$
C	$1 D \leq A < 10 D$

# Security of high radioactive sealed sources

## Dangerous quantities of radioactive material

### **Gammacell 40 Research Irradiator**

Nuclide: Cs-137

$A_0$ : 109.9 TBq (1st of November 2006)

Half life T: 30.08 a

$A_t$ : 81.4 TBq (December 3, 2019)

D-value of Cs-137: 0.1 TBq

81.4 TBq of Cs-137  $\equiv$  814 D-values

$\Rightarrow$  *Protection class B (CH)*

### **Gammacell 3000 Research Irradiator**

Nuclide: Cs-137

$A_0$ : 55 TBq (1st of December 1996)

Half life T: 30.08 a

$A_t$ : 32.4 TBq (December 3, 2019)

D-value of Cs-137: 0.1 TBq

32.4 TBq of Cs-137  $\equiv$  324 D-values

$\Rightarrow$  *Protection class B (CH)*

### **Sum D-values of both high radioactive sealed sources in the gamma irradiation room**

814 D-values + 324 D-values = 1138 D-values  $\Rightarrow$  *Protection class A (CH)*

# Security of high radioactive sealed sources

## Comparison of security requirements (class A and B)

Security requirement	Protection class A	Protection class B
Number of physical barriers	≥ 2	
Resistance class of physical barrier	RC4 (≥ 1 barrier)	RC3 (≥ 1 barrier)
Lock	Mechanical, 2-factor authentication (key, badge, PIN, etc.)	Mechanical
Access protocol	Electronic storage of every access	-
Intrusion detection	After detection ≥ 2 barriers have to be overcome	After detection ≥ 1 barriers has to be overcome
Trustworthiness check of the authorized persons	Identity, CV, references, criminal record, debt record	Identity, CV, references
Security system check	Every day	Every week

Thank you

for your attention!
